BACKGROUND

COVID-19 is the abbreviated name for novel Coronavirus Disease 2019 that first emerged in Wuhan, Hubei Province, China and spread globally. Coronavirus disease 2019 (COVID-19) is a respiratory illness that can spread from person to person through respiratory droplets.

The situation with this outbreak is evolving rapidly with new information being learned daily. The CDC is monitoring the outbreak and working closely with federal, state, and local health departments. Because of this, healthcare personnel working in post-acute and long-term care (PALTC) settings should refer to the CDC website for the latest updates:

Illness: COVID-19 illness may be mild to severe. Symptoms may appear as soon as 2 days and as long as 14 days after exposure. Symptoms include fever, dry cough, and shortness of breath. Other symptoms include diarrhea, nasal congestion, runny nose, and sore throat. These symptoms are usually mild and begin gradually. Some people who are infected may remain asymptomatic. Up to 80% of infected people recover without any need to seek care. Some will develop severe illness (typically in the second week of illness) and at present it is estimated that around 2% will die. Just as with influenza and other viral infections, older adults and patients with comorbid conditions are at increased risk for more severe illness.

Transmission: COVID-19 is spread from person-to-person by respiratory droplets between people who are in close contact with one another (about 6 feet). Spread from surfaces or objects (fomites) may also be a possible mechanism of transmission. At present, COVID-19 is not felt to be spread through airborne transmission such as seen with tuberculosis or measles.

The vision of AMDA – The Society for Post-Acute and Long-Term Care Medicine is a world in which all post-acute and long-term care patients and residents receive the highest-quality, compassionate care for optimum health, function, and quality of life.
INTERIM RECOMMENDATIONS FOR POST-ACUTE & LONG-TERM CARE FACILITIES

The situation with this outbreak is evolving rapidly with new information being learned daily. The CDC is monitoring the outbreak and working closely with federal, state, and local health departments. Because of this, healthcare personnel working in post-acute and long-term care (PALTC) settings should refer to the CDC website for the latest updates. 

Who Should Be Evaluated As A Suspected Case: People returning from sites where there is ongoing person-to-person transmission of COVID-19, or who have been in close contact with individuals known to be infected with COVID-19 were initially at greatest risk for COVID-19. Such individuals were part of the CDC’s case definition used to determine when to evaluate individuals for COVID-19. On February 27, 2020, the CDC updated its guidance to also consider COVID-19 in individuals with fever and severe lower respiratory failure requiring hospitalization without an alternative diagnosis. On March 4, 2020, the CDC updated its criteria for testing based on clinical judgement and the local epidemiology of COVID-19. 

- We recommend healthcare personnel regularly monitor the CDC website for updates on the spread of COVID-19 globally and the United States and modifications of the criteria for testing.

How Should Post-Acute and Long-Term Care (PALTC) Facilities Manage Individuals with Suspected COVID-19: With the spread of COVID-19 across several communities in the United States, healthcare personnel should be aware of their local epidemiology and enhance their surveillance for acute respiratory illness. If a resident is suspected as having COVID-19, we recommend that facilities contact their local and/or state public health department for guidance on management.

The virus is thought to spread mainly from person-to-person through respiratory droplets produced when an infected person coughs or sneezes. Ideally, when evaluating someone for COVID-19, healthcare facilities should implement Airborne Precautions, and Eye Protection in addition to Standard and Contact Precautions. This means wearing a gown, gloves, an N-95 facemask, and goggles or a face shield during the care. However, PALTC facilities in multiple regions are reporting shortages of N-95 masks. PALTC facilities generally do not stock N-95 masks since most sites do not have airborne isolation capabilities. Most PALTC staff are not being routinely fit tested for use of N-95 masks. Many PALTC facilities are currently indicating they are not able to obtain N-95 masks from their suppliers. As such, it is highly likely N-95 masks will not be available to most PALTC facilities, particularly as the number of cases of COVID-19 expand.
Given the available information on transmission and in consideration of the issues of limited access to adequate supplies of N95 masks, the following strategies are reasonable options which are consistent with World Health Organization (WHO) recommendations and CDC recommendations for resource-limited settings. Facilities should consult with public health authorities when considering these recommendations.

- **We recommend staff use surgical masks and eye protection or face shield before administering any respiratory treatment which may result in aerosolization of viral particles to individuals with suspected respiratory viral infection.** Examples of respiratory treatments which may lead to aerosolization of viral particles include use of nebulizers, suctioning, and tracheostomy care. This includes obtaining respiratory specimen in individuals likely to have COVID-19 or influenza.

- **If N-95 masks are available to PALTC providers, we recommend staff prioritize use of N-95 masks to individuals caring for residents likely to have COVID-19.**

- **If N-95 masks are in limited supply to PALTC providers, we recommend staff prioritize use of N-95 masks during respiratory procedures likely to result in aerosolization of viral particles. During all other lower-risk care, surgical masks should be utilized.**

- **If N-95 masks are not available, we recommend use of surgical masks during all care provided to individuals likely to have COVID-19.**

- **We recommend frequent hand hygiene with alcohol-based hand rub or soap and water, washing for at least 20 seconds.**

- **We recommend frequent cleaning with an EPA-registered, hospital-grade disinfectant of commonly touched environmental surfaces to decrease environmental contamination.** Frequent cleaning means at least daily. More frequent cleaning would be advisable if time and resources permit. [https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html](https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html)

Most PALTC facilities will not have airborne isolation rooms (often called negative pressure rooms).

- **If an individual meets the CDC case definition of a suspected case, we recommend facilities place the individual in a single room with a closed door pending consultation with their local health department.**

Reducing The Risk Of Introducing COVID-19 In Your Post-Acute and Long-Term Care Facility:

**Surveillance:** Active monitoring and surveillance are important to early detection and recognition of potential outbreaks of all infectious illnesses in long-term care settings.* Facilities should already have an active surveillance program in place capable of identifying cases, clusters, and outbreaks of disease.

- We recommend facilities reassess their surveillance program and take any necessary steps to optimize its performance.

**Employees:** Because healthcare personnel reside in the community and work in facilities, they have the potential to introduce infections into PALTC populations. As with all situations, healthcare personnel who are ill should stay home and seek healthcare advice through their regular provider. Those with mild symptoms are encouraged to call, rather than going in person, for medical advice.

- We strongly recommend healthcare providers avoid working while ill.
- We strongly recommend healthcare facilities implement staff policies to allow and account for potential absenteeism during community-wide outbreaks.
- If there is evidence of community-wide COVID-19 illness, we recommend facilities screen staff at entry into the facility for fever and ask about signs and symptoms of respiratory illness or diarrheal illness.
- If there is evidence of community-wide activity, we recommend that facilities encourage staff self-reporting of recognized exposure and refer them to an occupational health program that should refer to the CDC guidance on healthcare personnel with COVID-19 exposure in conjunction with the local and state health department.**
  
- If there is evidence of community-wide activity, we recommend that staff caring for residents use gloves and surgical masks in the care for every resident.

**Visitors:** Like healthcare personnel, visitors may also inadvertently foster spread of infections in the PALTC setting. Given the unique nature of the PALTC setting, it will not likely be possible to prohibit all visitors in the event of community-wide COVID-19 illness. For example, individuals on hospice should be able to visit with family members who are not ill.

- Consistent with good routine practice, we recommend posting signs requesting that people with acute respiratory illness to refrain from entering the PALTC facility. This applies whether or not there is COVID-19 activity in the community.
- We recommend individuals (regardless of illness presence) who have a known exposure to someone with a COVID-19, or who have recently traveled to areas with COVID-19 transmission, refrain from entering the nursing home.
- If there is community-wide transmission of COVID-19, we recommend facilities consider not permitting entry of any non-essential personnel. These include family, friends, and volunteers. We consider hospice personnel to be essential.

Planning: As part of a facility’s regular risk assessment, PALTC facilities should develop plans to prepare for and respond to potential outbreaks and/or pandemics. Plans developed for pandemic influenza are reasonable models to use in addressing the prevention and management of COVID-19.*** Key measures for this include:

- Call your state and/or local health department (for testing and guidance)
- Practice social distancing, including suspending group activities including dining and other social events
- Consistent staff, in which staff are assigned to the same unit or hallway on a consistent basis
- Daily temperature checks and symptom monitoring for residents and staff
- Furlough for staff with respiratory symptoms
- Have a plan to bring in temporary staff, perhaps through an agency, when there is insufficient staffing due to illness or increased burden of care

Admitting New Residents with COVID-19: Current recommendations for the care of individuals with severe illness caused by COVID-19 include Standard Precautions, Contact Precautions, Airborne Precautions, and using eye protection. Facilities without a negative pressure room may consider placing an individual with COVID-19 in a single room with a closed door and adhere to the rest of the infection prevention and control practices recommended for caring for such individual. Such decisions should be made in consultation with the local public health department. ****

The length of time during which infected individuals shed virus is not yet known. As symptoms improve, the amount of virus shed by infected individuals should decrease. Based on experience with similar viruses, people with severe illness will shed more virus and for a longer period of time than those with mild COVID-19 infection. People with severe illness may continue to shed virus at least 12 days after symptom onset. The decision of when people no longer require isolation precautions should be made on a case-by-case basis. The CDC has issued guidance for transmission-based precautions for individuals discharged to a long-term care or assisted living setting. Even with this guidance, decisions will need to take into account the severity of the illness, comorbid conditions, resolution of fever, and clinical status of the individual.

- We recommend that nursing homes accept patients recovering from COVID-19 only after consultation with the referring facility, including the clinical staff caring for the patient at the bedside.
- We recommend that nursing homes should accept residents with a known COVID-19 infection when that individual can be placed in a single room with a closed door and
when there is sufficient and adequately trained staff to care for that individual and sufficient supplies of PPE.

- We recommend that facilities be familiar with current CDC recommendations regarding cessation of transmission-based precautions for individuals with COVID-19.
- We recommend facilities re-educate all staff, clinical and non-clinical on proper use of personal protective equipment (PPE) and infection control practices.
